

The “New” 360 Brake – Revolutionizing Motorcycle Brakes

- The 360 Brake System is the first and only compact, completely self-contained braking system for motorcycles that mounts around the axle and allows an unobstructed view of the bike’s wheels.
- The 360 Brake System utilizes a circular piston and pads activated by hydraulic pressure to deliver 360 degrees of braking power to the rotor.
- The new rotor, which is grooved and vented, together with the brake hat’s newly designed venting system, effectively eliminates dust build up while providing superior airflow to the brake.
- The 360 Brake System performs extremely well. It was tested in controlled conditions against a rigorous testing protocol based on the FM VSS 122 DOT test, and in some instances exceeded the protocol by well over 100%!
- The lower center of gravitational force on the hub helps the bike shift more braking force to the rear, making for safer and smoother stops.
- Fits 1", $\frac{3}{4}$ " and numerous metric size axles.
- 360 Brake currently works only with billet aluminum wheels. A custom hub spacer is required for most wheels.
- When ordering, please have the following information ready to assist in the ordering process: 1) The brand and size of your wheels. 2) The bolt pattern dimension of the wheel. 3) The axle diameter. 4) Your choice of finish: polished, color anodized or chrome. 5) Your motorcycle model and front end size for selection of the correct anti-rotation arm.
